Human AI Interaction

LECTURE 5 – LGT

Prototyping Human-Centred AI systems

[What do we want to get done today ?]

1. **Quiz & Interviews feedback** [20 min interactive Q&A]
2. **LGT-task: sketching out your possible solution — paper** [50 min]
 - start from your PoV, sketch possible solutions, get feedback from others, identify the main features
3. **SGT-task : sketching out your possible solution — figman** [30 min + SGT]
 - Progressively build 2-3 versions of a clickable prototype for the key features you are interested in testing; get feedback often!

[mentimeter – week 5]

Human-centred AI as a Design Process

Part 2: Prototyping human-centred AI
systems

Dr Georgia Panagiotidou

[theme of the day]

Making up our minds ... aka 'think through building'

*Drag, drop, click, and pray
"It works!" (for exactly once)
Ship it anyway*

*There once was a coder named Jay
Who prototyped ten times a day
His demos looked great
Till users could rate:
"The button does nothing but sway*

[our design brief]

Design a system that will

- *guide students to likely set of challenges or difficulties with a learning material (e.g., crucial concepts that are likely to be on the exam);*
- *do so in an ideally personalised way—if possible; and*
- *then provide the students with an opportunity to test their knowledge (e.g., through a mock oral exam / job interview).*

[your point of view]

... should be one possible direction to find an answer to the design brief

*Drag, drop, click, and pray
"It works!" (for exactly once)
Ship it anyway*

*There once was a coder named Jay
Who prototyped ten times a day
His demos looked great
Till users could rate:
"The button does nothing but sway*

[LGT task – work in triads]

Your mission:

draw on your PoV and interviews to identify key features

Step 1: Take 20 minutes to list possible features to address your PoV.

Your goals are to:

- Think about the core AI interactions that would be needed
- Write lots of ideas first (first 10 min), curate later (second 10 min)
- Sketch 2-3 key features in a way you can present to another team

You will be testing the interview with a person from another team in Step 2!

[LGT task – work in triads]

Your mission:
draw on your PoV and interviews to identify key features

Step 2: Take 10 minutes to get feedback from another team

Your goals are to:

- Explain the 2-3 key features quickly (2 min)
- Get the other person to ask questions & provide critique (8 min!)

[LGT task – work in triads]

Your mission:
draw on your PoV and interviews to identify key features

Step 3: Take 15 minutes to sketch out your core prototype flow

Your goals are to:

- Think about how features click together
- Get ready to move into prototyping in Figma for the SGT task

[SGT task – work in triads]

Your task will be to create a Figma prototype that illustrates the key ideas & features of your envisioned system + collect feedback

... this will be the basis actually building out your system in the next week LGT + SGT!

... your point of view here ...

Role: Design team continuing to explore the topic ^^

Output: One files to submit, which should include:

1. **Your figma link + screenshot**
2. **Summary of user feedback you have received**
3. **Any remaining planned changes for next LGT**

[SGT task – work in pairs / triads]

Suggested time progression:

- spend **30 minutes** on sketching out your paper idea into Figma,
- spend **10 minutes** to get feedback from another team
- **rest of time** to update your figma prototype & write up your SGT submission

1. Classic d.school POV Mad Lib

[User] needs a way to [user's need] because [surprising insight].

Example:

A first-time college student needs a way to feel connected on campus because orientation week feels overwhelming and impersonal.

2. Emotion-Focused POV

[User] feels [emotion] when [situation], and needs a way to [user's need] so they can [desired emotional outcome].

Example:

A remote worker feels isolated when working alone all week, and needs a way to build small social connections so they can feel part of a team.

3. Constraint-Focused POV

[User] needs a way to [user's need], but is limited by [constraint/barrier], because [insight about why this matters].

Example:

A busy parent needs a way to exercise regularly, but is limited by childcare responsibilities, because they can't find safe, flexible fitness options at home.

4. Behavior-Focused POV

[User] is trying to [behavior or goal], but struggles because [barrier or misunderstanding], so they need a way to [help them succeed].

Example:

A commuter is trying to bike to work, but struggles because there's no safe storage for their bike, so they need a way to store it securely near the office.

5. Context + Insight POV

In the context of [situation or environment], [user] needs [need] because [human insight about motivation or behavior].

Example:

In the context of hospital waiting rooms, family members of patients need reassurance and updates because uncertainty amplifies their stress and helplessness.
